Oligodeoxynucleotides for inducing an immune response to treat and prevent an allergic reaction, cancer, an autoimmune disorder and symptoms resulting from exposure to bio-warfare agents, comprise multiple CpG sequences.

Claim 5; Page 43; 48pp; English.

AAS09551-AAS09662 represent oligodeoxynuclectides (ODN) of at least 10 nuclectides comprising multiple CpG sequences, where one of the CpG sequences is different from another of the multiple CpG sequences. The

```
mediated immune response, involving non-B cell activation, interferon gamma (IFN-gamma) production or a humoral immune response involving B cell activation, antibody and interlevin-6 production in a host, for treating, preventing or ameliorating an allergic reaction, e.g. asthma, cancer, e.g. solid tumour cancer, a disease associated with the immune system e.g. autoimmune disorder or an immune system deficiency, infection or a symptom resulting from exposure to bio-warfare agent in a human. The induction of immune response improves the efficacy of a vaccine and is used in antisense therapy. The ODN are useful for treating, preventing or ameliorating allerapy. The ODN are useful for treating, preventing or coryza, hay fever, bronchial asthma, urticaria (hives), food allergies and other atoppic conditions, for improving the efficacy of vaccines cand other atoppic conditions. For improving the efficacy of vaccines cand other atoppic conditions. For improving the efficacy of vaccines cand other atoppic manue system deficiencies, e.g. lupus creating immune system deficiencies, e.g. lupus creating immune system deficiencies, e.g. lupus creating immune diseases such as rheumatoid arthritis and multiple sclerosis, infections including Prancisella schistosomiasis, tuberculosis, acquired immunodeficiency syndrome (AIDS), Leishmania and contractions resulting from exposure of bio-warfare agent, including Bbola,

                                                                                                                                                                                                                  The present invention relates to an immunostimulatory composition, which comprises at least one oligonucleotide comprising both an RNA region and bNA region. The composition is useful for enhancing an immune response or inducing cytchines. It can be used as a vaccine adjuvant and in treating diseases, including pathogenic infection, (non-)malignant tumours (e.g. cancers of the brain, lung, ovary, breast, prostate or colon, or carcinomas and sarcomas), autoimmune diseases or allergies (e.g. allergic rhinitis, hay fever or food allergies), Lywe disease, heparitis, HIV or malaria. The composition is also useful for treating, preventing or ameliorating the symptoms resulting from exposure to a biowarfare agent, e.g. Boola, Anthrax or Listeria. The present sequence is an immunostimulatory oligonucleotide described in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1. .20 /*reag= a //oreagle //oreagle

Generating mature dendritic cells for tumor immunotherapy or as vaccines for activating the immune system to treat diseases such as cancer, comprises contacting a dendritic cell precursor with a D type oligodeoxymucleotide. 

Disclosure, Fig 8; 69pp; English.

The present sequence is that of CpG oligodeoxynucleotide DV30 of the invention. A claimed method for generating dendritic cells involves contacting a dendritic cell precursor, especially a monocyte, with a D type oligodeoxynucleotide (see ACC48294) containing a central unmethylated CpG motif. The method is useful for generating mature presentation. Mature dendritic cells are useful for tumonocherapy, for augmenting an immune response to an infectious agent or to a vaccine, and as vaccines to prevent future infection or to activate the immune system to treat diseases such as cancer. Mature dendritic cells may also be used to produce activated I lymphocytes

Mature dendritic cells are obtained by contacting a dendritic cell precursor, such as a monocyte, with such an oligodeoxynucleotide. The method is useful for generating mature dendritic cells and enhancing T cell responses, thus enhancing antigen presentation. Mature dendritic cells are useful for tumour immunotherapy, for augmenting an immune response to an infectious agent or to a vaccine, and as vaccines to diseases such as cancer. Mature dendritic cells may also be used to produce activated I lymphocytes

The invention relates to sterically stabilised cationic liposomes (SSCL) which comprises a cationic lipid, a co-lipid, stabilising agent and encapsulating a K type oligodeoxynucleotide (ODM) including a CpG motif. The invention is useful in pharmaceutical composition for impairing crowth of a solid tumour cell (e.g. human tumour cell) bearing an innerleukin-13 receptor in a subject; for stimulating an immune response, which is expression of a cytokine (e.g. interferon gamma), particularly innucherapeutic response against tumours or stimulating an in vivo or con infectious agent e.g. virus, bacteria and furnagus. It is also useful for delivering oligodeoxynucleotides including a cype motif in clinical applications; for treating infectious diseases (e.g. tularemia, malaria, francisella, schistosomiasis, tuberculosis and leishmaniasis), cancer (e.g. solid tumours, AIDS-associated Kaposi's tumour, thyroid cancer cot), allergy (e.g. eczema, allergic rhinitis or coryza, hay fever, bronchial or allergic asthma, utticaria, food allergies), autoimmune diseases (e.g. diabetes, rheumatoid arthritis, lupus erythematosus and multiple sclerosis) and psoriasis. The present sequence is a D class CpC oDN potentially useful for encapsulating in SSCL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The present invention describes a method for inducing the production of vascular endothelial growth factor (VEGF) by a cell comprising contacting the cell with a CpG oligonucleotide and therefore inducing the production of VEGF by the cell. Also described: (1) inducing neovascularisation in a tissue, comprising introducing a CpG oligonucleotide into an area of the inducing neovascularisation in the area of the tissue; (2) promoting angiogenesis in an area of the subject where angiogenesis is desired, and so inducing neovascularisation in the area of the tissue; (2) promoting angiogenesis in an area of the subject where angiogenesis is desired, comprising information of angiogenesis in the subject where angiogenesis is desired, comprising information a CpG oligonucleotide to a non-human mammal and administering a CpG oligonucleotide to a non-human mammal and administering the agent to the mammal, where inhibition of angiogenesis in the enimal indicates that the capent is effective in inhibiting neovascularisation. The CpG oligonucleotides have vulnerary, vasotropic and antiarteriosclerotic activities, and can be used in gene therapy. The method and the CpG oligonucleotides can be used in gene therapy. The method and the CpG oligonucleotides can be used in indicing angiogenesis or neovascularisation, such as in subjects with a skin graft, subjects who exhibit male pattern baldness, or subjects with a skin graft, subjects who contacterosis or ischaemia. The method may also be used in screening for represents a CpG oligonucleotide which is used in the exemplification of the rearent invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Inducing the production of vascular endothelial growth factor by a cell, useful for inducing angiogenesis, comprises contacting the cell with a CPG oligodeoxymucleotide.
                                                                                                                                                                                                                                                                                                                                 vascular endothelial growth factor; VEGF; CpG oligonucleotide; neovascularisation; angiogenesis; vulnerary; vasotropic; antiarteriosclerotic; gene therapy; skin graft; male pattern baldness; atherosclerosis; ischaemia; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 20 BP; 3 A; 4 C; 11 G; 2 T; 0 U; 0 Other;

The present invention relates to an immunostimulatory composition, which comprises at least one oligonucleotide comprising both an RNA region and DNA region. The composition is useful for enhancing an immune response or inducing cytokines. It can be used as a vaccine adjuvant and in treating diseases, including pathogenic infection, (non-)malignant tumours (e.g. cancers of the brain, lung, ovary, breast, prostate or colon, or carcinomas as arcomas), autoimmune diseases or allergies (e.g. allergic thinitis, hay fever or food allergies), Lyme disease, hepatitis, HIV or malaria. The composition is also useful for treating, preventing or ameliorating the symptoms resulting from exposure to a biowarfare agent, e.g. Ebola, Anthrax or Listeria. The present sequence is an immunostimulatory oligonucleotide described in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                          1..28 "A*tag= a

New immunostimulatory compositions comprising RNA/DNA hybrid oligonuclectides, useful for enhancing an immune response or inducing cytokines, particularly for treating diseases, e.g. cancer, allergy or HIV infection.

Example 11; Page 61; 68pp; English.

The present invention relates to an immunostimulatory composition, which comprises at least one oligonucleotide comprising both an RNA region and DNA region. The composition is useful for enhancing an immune response or inducing cytokines. It can be used as a vaccine adjuvant and in treating diseases, including pathogenic infection, (non-)malignant tumours (e.g. cancers of the brain, lung, ovary, breast, prostate or colon, or carcinomas and sarcomas), autoimmune diseases or allergic thinitis, hay fever or food allergies), Lyme disease, hepatitis, HIV or malaria. The composition is also useful for treating, preventing or ameliorating the symptoms resulting from exposure to a biowarfare agent, e.g. Ebola, Anthrax or Listeria. The present sequence is an immunostimulatory oligonucleotide described in the exemplification of the invention

Novel oligonucleotides useful for the prevention and treatment of allergies, cancer, and autoimmune disorders and for ameliorating symptoms resulting from exposure to a bio-warfare agent.

Claim 4; Page 37; 46pp; English.

The invention relates to novel immunogenic CpG oligodeoxynucleotides CG (AAC80581-C80723). The oligonucleotide are at least 10 bases long and comprise one of the generic sequences 5-NNNT-CpG-WNNN-3' or 5-RY-CpG-RY -3'. The central CpG motif is unmerthylated, and the oligonucleotides optionally have phosphorothioate linkages which make them more resistant code degradation. The invention also relates to an oligonucleotide designant, and a pharmaceutical composition comprising the oligonucleotide delivery complex. The oligonucleotides are able to induce either a cell-composition comprising the oligonucleotides of the sequence 5'-RY-CpG-RY-3' being able to induce a cell-mediated response, and those of the sequence 5'-RNTW-CpG-RNN-3' cell-mediated response, and those of the sequence 5'-RN-CpG-RY-3' being able to induce a humoral response of the sequence 5'-RN-CpG-RY-3' being able to induce a demoral response. It is thought that after administration, the oligonucleotide acts on antigen-presenting cells cell-mediated or cell-mediated or natural killer (RN) cells. A cell-mediated or chumoral response can then occur by activation of T- or B-cells. The chumoral response can then occur by activation of T- or B-cells. The induction of an immune response is useful for treating, preventing or ameliorating an allergic reaction (preferably asthma), or an infection, where an immunogenic CpG oligonucleotide is administered either alone or in combination with an anti-allergenic agent or anti-infectious agent. The allergic conditions which may be treated include eczema, allergic conditions which may be treated include strail, fungal and protozoal infections such as tuberculosis, Ald in the treatment of an autoimmune elsone induction may also be used in the treatment of an autoimmune elsone elsone elsone induction in the treatment of an autoimmune elsone elson

```
erythematosus, rheumatoid arthritis and multiple sclerosis), a disease associated with immune system deficiency, and symptoms resulting from exposure to an agent of biological warfare. An immunogenic CpG oligonuclectide, either alone or in combination with an anti-cancer oligonuclectide, either alone or in combination with an anti-cancer immunosers. The induction of an immune response is used in antisenes therapy and to improve the efficacy of a vaccine. The oligonuclectide is preferably administered to the present settivated lymphocytes which are then administered to the host. The present sequence represents an immunogenic CpG oligodeoxynuclectide of the invention

Oligodeoxynucleotides for inducing an immune response to treat and prevent an allergic reaction, cancer, an autoimmune disorder and symptoms resulting from exposure to bio-warfare agents, comprise multiple CpG sednences

Claim 5; Page 41; 48pp; English.

AASO9551-AASO9662 represent oligodeoxynucleotides (ODN) of at least 10 nucleotides comprising multiple CpG sequences, where one of the CpG sequences is different from annother of the multiple CpG sequences. The ODN are useful for inducing an immune response, preferably a cell-mediated immune response, involving non-B cell activation, interferon gamma (IRN-gamma) production or a humoral immune response involving B cell activation, antibody and interleukin-6 production in a host, for treating, preventing or ameliorating an allergic reaction, e.g. asthma, 

system e.g. autoimmune disorder or an immune system deficiency, infection of a symptom resulting from exposure to bio-warfare agent in a human. The induction of immune response improves the elificacy of a vaccine and used in antisense therapy. The ODN are useful for treating, preventing or manellorating allergic reactions, including eczema, allergic rhinitis or coryza, hay fever, bronchial asthma, urticaria (hives), food allergies and other atopic conditions, for improving the efficacy of vaccines and other atopic conditions, for improving the efficacy of vaccines against hepatitis A. B and C, human immunodeficiency virus (HIV) and malaria, for treating immune system deficiencies, e.g. lupus erythematosus and autoimmune diseases such as rheumatoid arthritis and multiple solerosis, infections including Franciscalla, solistosomiasis, tuberculosis, acquired immunodeficiency syndrome (AlbS), leishmania and symptoms resulting from exposure of bio-warfare agent, including Ebola, e.g. solid tumour cancer, a disease associated with the immune Anthrax and Listeria

Vaccine for immunizing patient against respiratory syncytial virus, has epitopes of Paramyxoviridae P protein, and cytosine followed by guanine linked by phosphate bond-oligodideoxynucleotides.

Claim 4; Page 9; 30pp; English.

φ The invention describes a vaccine comprising one or more epitopes of a Paramyxoviridae F protein, and one or more CpG (cytosine followed by guanine linked by phosphate bond) oligodideoxynucleotides (ODNs). The vaccine is useful for vaccinating a patient especially against viruses the Paramyxoviridae family e.g. respiratory syncytial virus (RSV), the primary cause of viral bronchiolitis and pneumonia in infants and children, and infectious pulmonary disease in infants. RSV has been particularly implicated in death of infants that are premature, have

```

```
The present invention relates to an immunostimulatory composition, which comprises at least one oligonucleotide comprisant both an RNA region and a DNA region. The composition is useful for enhancing an immune response or inducing cytokines. It can be used as a vaccine adjuvant and in treating diseases, including pathogenic infection, (non-)nalignant tumours (e.g. cancers of the brain, lung, ovary, breast, prostate or colon, or carcinomas and sarcomas), autoimmune diseases or allergies (e.g. allergic rhintis, hy fever or food allergies), Lyme disease, hepatitis, HIV or malaria. The composition is also useful for treating, preventing or ameliorating the symptoms resulting from exposure to a biowarfarre agent, e.g. Ebola, Anthrax or Listeria. The present sequence is an immunostimulatory oligonucleotide described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1..18

```

is the number of results predicted by chance to have a Pred. No.

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /inte="Vector: pBluescript II SK-; Site_1: EcoRI; Site_2: XhoI; This library, constructed by John Davies and Jeffrey McDermott, combines cDMAs from CC-1690 cells grown to mid-log phase in TAP (acetace-containing) medium in the light. TAP medium in the dark, HS (minimal) medium in a new mobient levels of CO2 and HS medium bubbled with 5% CO2 PO17A mRNA was purified from each sample, pooled and cDNA synthesized. The cDNA was directionally cloned in CDNA SYNTHESIZED. IN CETALGEND IN the ECORI (5') and XhoI (3') sites. DBluescript II SK- plasmids were excised from the lambda ZAP II (Strategene) in the ECORI (5') and KhoI (3') sites. DBluescript II SK- plasmids were excised from the lambda ZAP clones by superinfection with Exassist (Strategene) phage. The library was normalized using method 4 described in Bonaldo et al (1996) Genome Research 6: 791-806."

Hall clones with suffix qlc are reverse primer reads starting at 5 end of the cDNA all plc reads are from
the 3' end.

subtraction of the BB16 library with 4000 previously sequenced clones. The BB16 library was contributed by the Soares laboratory and it was constructed and normalized as described by Bonaldo, M.F., Lennor, G. and Soares, M.B. (1996), Genome Research 6(9): 791-806. RNA was prepared from dissected brains of adult worker bees of various ages and various behavioral groups.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A1812904 S04 bp mRNA linear BST 08-JUL-1999

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

invention. Mature dendritic cells are obtained by contacting a dendritic cell precursor, such as a monocyte, with such an oligodeoxymuclectide. The method is useful for generating mature dendritic cells and enhancing T cell responses, thus enhancing antigen presentation. Mature dendritic cells are useful for tumour immunotherapy, for augmenting an immune response to an infectious agent or to a vaccine, and as vaccines to prevent future infection or to activate the immune system to treat diseases such as cancer. Mature dendritic cells may also be used to
                                                                                                                                                                                                                                                  produce activated T lymphocytes

Novel oligonuclectides useful for the prevention and treatment of aliergies, cancer, and autoimmune disorders and for ameliorating symptoms resulting from exposure to a bio-warfare agent.

Claim 4; Page 35; 46pp; English.

The invention relates to novel immunogenic CpG oligodeoxynucleotides (AAC80581-C80723). The oligonucleotide are at least 10 bases long and comprise one of the generic sequences 5'-NNNT-CpG-WNNN-3' or 5'-RY-CpG-RY-3'. The central CpG motif is unmerthylated, and the oligonucleotides optionally have phosphorothicate linkages which make them more resistant to degradation. The invention also relates to an oligonucleotide delivery complex comprising an oligonucleotide of the invention and a targetting

cc agent, and a pharmaceutical composition comprising the oligonuclectide delivery complex. The oligonuclectides are able to induce either a cell-mediated (T-cell) response, with oligonuclectides of the sequence 5'-RY-CpG-RY-3' being able to induce a cell-mediated response, and those of the sequence 5'-RNMT-CpG-WNN-3' being able to induce a humoral response. It is thought that after administration, the oligonuclectide acts on antigan-presenting cells (e.g., macrophages and dendritic cells), which then release cytokines, leading to exitvation of natural Xiller (NR) cells. A cell-mediated or humoral response can then occur by activation of T- or B-cells. The induction of an immune response is useful for treating, preventing or ameliocrating an allergic reaction (preferably asthma), or an infection, where an immunogenic CpG oligonuclectide is administered either alone or in combination with an anti-allergenic agent or anti-infectious agent. The allergic conditions which may be treated include exerma, allergic conditions which may be treated include viral, conditions, and the infections which may be treated include viral, conditions, and the infections which may be treated include viral, conditions, include approceased infections such as tuberculosis, ALDS, besterial, fungal and protozoal infections such as tuberculosis, ALDS, cleshmania and schistosomiasis. Immune response induction may also be exposure to an agent of biological warfare. An immunogenic CpG oligonuclectide, either alone or in combination with an anti-cancer agent, is useful for treating solid tumour cancer. The induction of an immune response is used in antisense therapy and to improve the efficacy of a vaccine. The oligonuclectide is preferably administered to the host. The present sequence represents an immunogenic CpG oligodeoxynuclectide of the invention

```
AASO9551-AASO9662 represent oligodeoxynuclectides (ODN) of at least 10 nuclectides comprising multiple CpG sequences, where one of the CpG sequences is different from another of the multiple CpG sequences. The converse is different from another of the multiple CpG sequences. The converse is different from another of the multiple of sequences. The converse is different on inducing an immune response involving a cell activation, interferon gamma (IRN-gamma) production or a humoral immune response involving B cell activation, antibody and interleukin-6 production in a host, for treating, preventing or ameliorating an allergic reaction, e.g. asthma. Cc ancer, e.g. solid tumour cancer, a disease associated with the immune system e.g. autoimmune disorder or an immune system deficiency, infection or a symptom resulting from exposure to bio-warfare agent in a human. The induction of immune response improves the efficacy of a vaccine and is used in antisense therapy. The ODN are useful for treating, preventing or ameliorating allergic reactions, including eczema, allergic rhinitis or coryza, hay fever, bronchial asthma, urticaria (hives), food allergies and other atopic conditions, for impreving the efficacy of vaccines cand other atopic conditions, for impreving the efficacy of vaccines cand other atopic conditions, for impreving the efficacy of vaccines cand other atopic conditions, for impreving the efficacy of vaccines cand other atopic conditions, for impreving the efficacy of vaccines cand other atopic conditions, for impreving the efficacy of vaccines corythearcuses and autoimmune system deficiency virus (HIV) and malaria, for treating immune system deficiency syndrome (AlDS), leishmania and multiple sclerosis, infections including Francisella, ecities and multiple sclerosis, infections including Prancisella, ecities and the efficacy of vaccines of symptoms resulting from exposure of bio-warfare agent, including Ebola,
                                                                                                                                        Oligodeoxynuclectides for inducing an immune response to treat and prevent an allergic reaction, cancer, an autoimmune disorder and symptoms resulting from exposure to bio-warfare agents, comprise multiple CpG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   94.4%; Score 17; DB 4; Length 19; 100.0%; Pred. The invention describes a vaccine comprising one or more epitopes of a Paramyxoviridae F protein, and one or more CpG (cytosine followed by quantine linked by phosphate bond) -oligodideoxymucleotidaes (DNBs). The vaccine is useful for vaccinating a patient especially against viruses of the Paramyxoviridae family e.g. respiratory syncytial virus (RSV), the primary cause of viral bronchiolitis and pneumonia in infants and children, and infectious pulmonary disease in infants. RSV has been particularly implicated in death of infants that are premature, have represents an oligodideoxymucleotide that can be used in the creation of the vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CpG oligodecoxynucleotide; unmethylated; antigen-presenting cell; immunogenic; cytokine release; natural killer cell; NK cell activation; cell-mediated immune response; T-cell response; humoral response; B-cell response; antibody production; immune response induction; vaccine; allergy; asthma; infection; bacterial; viral; fungal; protozoal; parasitic; tuberculosis; AIDS; autoimmune disease; lupus erythematosus; rheumatoid arthritis; multiple sclerosis; solid tumour; cancer; immune deficiency; biological warfare agent; cytostatic; antiarthritic; antimatopial; antiallergic; protozoacide; tuberculostatic; antiarthritic; antiasthmatic; dermatological; phosphorothioate; ss.
                                                                                                   Vaccine for immunizing patient against respiratory syncytial virus, has epitopes of Paramyxoviridae F protein, and cytosine followed by guanine linked by phosphate bond-oligodideoxynucleotides.

The invention relates to novel immunogenic CpG oligodeoxymucleotides (AACGORDI-CBOTA). The oligomucleotide are at least 10 bases long and comprise one of the generic sequences \$\(\circ\)-NNNT-CpG-WNNY-1 or \$\(\circ\)-X-Y-CpG-XY-CCC (Comprise one of the generic sequences \$\(\circ\)-NNNT-CpG-WNNY-1 or \$\(\circ\)-X-Y-CpG-XY-CCC (Comprise one of the generic sequences \$\(\circ\)-NNT-CpG-WNNY-1 or \$\(\circ\)-X-Y-CpG-XY-CCC (Comprising an oligomucleotide delivery complex. The oligomucleotides which make them more resistant to degradation. The inventional also relates to an oligomucleotide delivery complex. The oligomucleotides are able to induce either a cell-mediated (T-cell) response or a humoral [8-cell, antibody) response, with oligomucleotides of the sequence 5'-RNY-CpG-RY-3' being able to induce a humoral response. It is thought that after administration, the oligomucleotide acts on antigen-presenting cells (e.g., macrophages and dendritic cells), which then release cytofines, leading to activation of natural killer (NK) cells. A cell-mediated or calls and an allergic reaction (preferably asthma), or an infection, and an immune response is useful for treating, preventing or meliorating an allergic reaction (preferably asthma), or an infection, where an immunogenic CpG oligomucleotide is administered either alone or in combination with an anti-allergenic agent or anti-infections, and the infections which may be treated include erzema, allergic conditions which may be treated include erzema, allergic conditions

Novel oligonucleotides useful for the prevention and treatment of allergies, cancer, and autoimmune disorders and for ameliorating symptoms resulting from exposure to a bio-warfare agent.

Claim 4; Page 30; 46pp; English

The invention relates to novel immunogenic CpG oligodecxynuclectides

(AAC80581-C80723). The oligonuclectide are at least 10 bases long and

comprise one of the generic sequences 5. "ANNT-"CpG-"NNN-3' or 5. RY-CpG-RY

-3'. The central CpG motif is unmethylated, and the oligonuclectides

comprise one of the generic sequences 5. "ANNT-"CpG-"RY-CpG-"RY

comprising an oligonuclectide of the invention and a targetting

agent, and a pharmaceutical composition comprising the oligonuclectide

complex comprising an oligonuclectides are able to induce either a cell
complex pomplex. The oligonuclectides are able to induce either a cell
complex pomplex. The oligonuclectides are able to induce either a cell
mediated (T-cell) response or a humoral [-cell, antibody) response, with

coligonuclectides of the sequence 5'-RY-CpG-RY-3' being able to induce a

coll-mediated response, and those of the sequence 5'-RNT-CpG-RNNN-3'

coll-mediated or induce a humoral response. It is thought that after

coll-mediated or induce a numeral response. It is thought that after

defining able to induce a numeral response. It is thought then release cytokines,

coll-mediated or immune response is useful for treating, preventing or

ameliorating an allergic reaction (preferably asthma), or an infection,

where an immunogenic CpG oligonuclectide is administered either alone or

conditions with an anti-allergenic agent or anti-infectious agent.

The allergic conditions which may be treated include eczema, allergic

conditions, and the infections which may be treated include viral,

ö bacterial, fungal and protozoal infections such as tuberculosis, AIDS, leishmania and sofistosomisais. Immune response induction may also be used in the treatment of an autoimmune disorder [e.g., lupus erythematosus, rheumatoid arthritis and multiple solerosis), a disease associated with immune system deficiency, and symptoms resulting from exposure to an agent of biological warfare. An immunogenic CpG oligomucleotide, either alone or in combination with an anti-cancer along each is useful for treating solid tumour cancer. The induction of an immune response is used in antisense therapy and to improve the efficacy of a vaccine. The oligomucleotide is preferably administered to any administered to the host. The present sequence represents an immunogenic CpG oligodeoxynucleotide of the invention Gaps .. Score 16.4; DB 4; Length 20; Pred.                                                                                                                                                                                                           The present invention relates to an immunostimulatory composition, which comprises at least one oligonucleotide comprising both an RNA region and a DNA region. The composition is useful for enhancing an immune response or inducing cytokines, it can be used as a vaccine adjuvant and in treating diseases, including pathogenic infection, (non-)malignant tumours (e.g. cancers of the brain, lung, ovary, breast, prostate or colon, or carcinomas and sarcomas), autoimmune diseases or allergies (e.g. allergic thinitis, hay fever or food allergies), Lywe disease, hepatitis, HIV or malaria. The composition is also useful for treating, preventing or ameliorating the symptoms resulting from exposure to a biowarfare agent, e.g. Ebola, Anthrax or Listeria. The present sequence is an immunostimulatory oligonucleotide described in the exemplification of
                                                                                                                         New immunostimulatory compositions comprising RNA/DNA hybrid oligonuclectides, useful for enhancing an immune response or inducing cytokines, particularly for treating diseases, e.g. cancer, allergy or HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /+tag= a

The present invention relates to an immunostimulatory composition, which comprises at least one oligonucleotide comprising both an RNA region and a DNA region. The composition is useful for enhancing an immune response or inducing cytckines. It can be used as a vaccine adjuvant and in treating diseases, including pathogenic infection, (non-)malignant tumours (e.g. cancers of the brain, lung, ovary, breast, prostate or colon, or carcinomas and sarcomas), autoimmune diseases or allergies (e.g. allergic rhinitis, hay fever or food allergies), Lyme disease, hepatitis, HIV or malaria. The composition is also useful for treating, preventing or ameliorating the symptoms resulting from exposure to a bio-warfare agent, e.g. Ebola, Anthrax or Listeria. The present sequence is an immunostimulatory oligonucleotide described in the exemplification of

The present invention relates to an immunostimulatory composition, which comprises at least one oligonuclectide comprising both an RNA region and a DNA region. The composition is useful for enhancing an immune response or inducing cytokines. It can be used as a vaccine adjuvant and in treating diseases, including pathogenic infection, (non-)malignant tumours (e.g. cancers of the brain, lung, ovary, breast, prostate or colon, or carcinomas and sarcomas), autoimmune diseases or allergies (e.g. allergic rhinitis, hay fever or food allergies), Lyme disease, hepatitis, HIV or malaria. The composition is also useful for treating, preventing or ameliorating the symptoms resulting from exposure to a biowarfare agent, e.g. Ebola, Anthrax or Listeria. The present sequence is an immunostimulatory oligonucleotide described in the exemplification of

                                                                             The invention describes a vaccine comprising one or more epitopes of a paramyxoviridae P protein, and one or more CpG (cytosine followed by guanine linked by phosphate bond)-oligodideoxynucleotides (ODNS). The vaccine is useful for vaccinating a patient especially against viruses of the Paramyxoviridae family e.g. respiratory syncytial virus (RSV); the primary cause of viral bronchlolitis and pneumonia in infants and children, and infectious pulmonary disease in infants. RSV has been particularly implicated in death of infants that are premeture, have bronchopulmonary dysplasia, or congenital heart conditions. This sequence represents an oligodideoxynucleotide that can be used in the creation of

Sequence 4226, Application US/09252991A

Sequence 4226, Application US/09252991A

Patent No. 6551798

TITLE OF INVENTION: NUCLEIC AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: NUCLEIC AND THERAPEUTICS

TITLE OF INVENTION: US/09/252,991A

CURRENT APPLICATION NUMBER: US/09/252,991A

CURRENT FILING DATE: 1998-02-18

PRIOR PILING DATE: 1998-02-18

PRIOR PILING DATE: 1998-07-27

PRIOR FILING DATE: 1998-07-27

SEQ ID NO 4236

LENGTH: 648
                                                                                                                                                                                                                                                                                                                                                                                      APPLICANT: WHITE, Owen R.
APPLICANT: WHITE, Owen R.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 18, Sequence 6, Al

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
